BAHAMAS PUBLIC FORECAST

BAHAMAS PUBLIC FORECAST FOR TONIGHT, TOMORROW AND THE NEXT SIX (6) DAYS, ISSUED BY THE BAHAMAS DEPARTMENT OF METEOROLOGY AT 6:00 P.M. EDT, Tuesday, July 15, 2025. THE NEXT SCHEDULED FORECAST WILL BE ISSUED AT 6:00 A.M. EDT TOMORROW.

WARNING IN EFFECT:	<i>There are currently no public warnings in effect at this time.</i>
GENERAL SITUATION:	<p>Conditions gradually improve across the northern islands as moisture associated with Invest 93L continues to pull north and away from the area. Meanwhile, the Bermuda-Azores High builds westward extending a ridge across the chain of islands. The pressure gradient is expected to strengthen tonight into tomorrow resulting in fresh to occasionally strong surface winds which may help to trigger shower activity and/or isolated thunderstorms, particularly in the northern islands, due to the presence of ample moisture and daytime heating.</p> <p>Outlook: A typical summertime pattern will persist into the weekend as high pressure remains dominant. Additionally, expect conditions to remain rather breezy to windy into the weekend as the pressure gradient remains strong across the area. Conditions become more unsettled late Sunday into next week as broad, deep troughing orients itself to the near east of the archipelago.</p>
SPECIAL WEATHER NOTES:	<p>Rip Currents: There is a moderate to high risk of rip currents affecting east and south coast beaches across all areas through tomorrow.</p> <p>Heat/UV Indices: The public is advised to remain hydrated, wear loose-fitted clothing and sunscreen while outdoors, and take frequent breaks during peak sunshine hours, as UV indices are expected in the high to very high range and heat indices will reach from the mid-90's to the lower triple digits.</p>

TROPICAL WEATHER OUTLOOK:	<p>Florida Peninsula into the Northeastern Gulf (AL93): Satellite and radar data indicate that the low pressure area previously over the Atlantic is moving onto the coast of northeastern Florida. This system is currently producing disorganized shower and thunderstorm activity, and little development is expected through tonight while the center is over land. Once the system reaches the northeastern Gulf on Wednesday, environmental conditions appear generally favorable for additional development, and a tropical depression could form while the system moves across the northeastern and north-central Gulf and approaches the coast of Louisiana on Thursday.</p> <p>Formation chance through 7 days is a medium 40 percent.</p> <p>Elsewhere, tropical cyclone formation is not expected through the next 7 days.</p>
