DEPARTMENT OF

## Rainfall Patterns October to December 2025

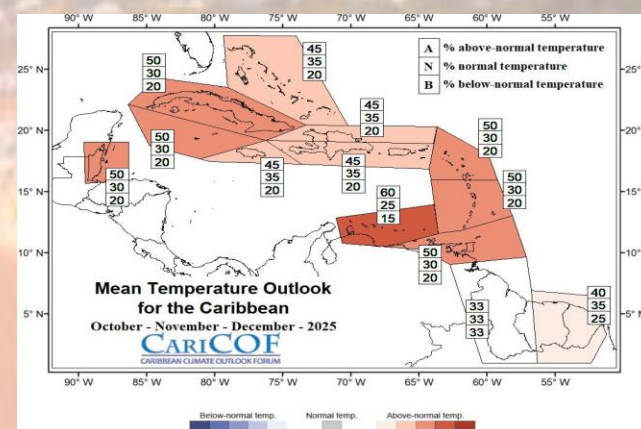

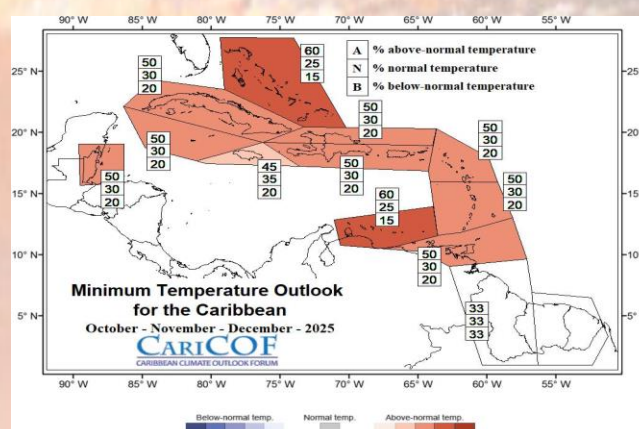

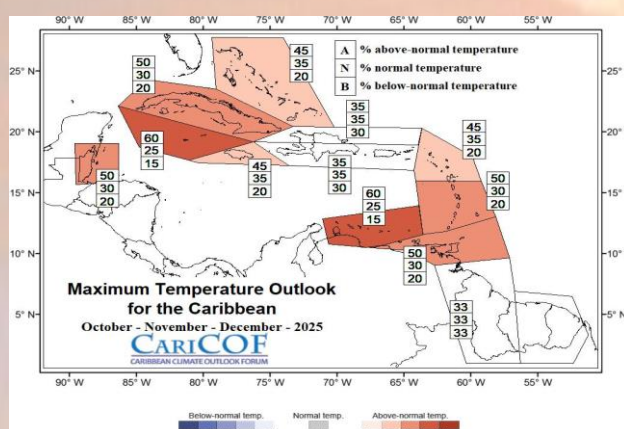

*In The Bahamas, October is the peak of the wet season, marked by frequent heavy rain showers. By December, the weather shifts to the dry season, with showers becoming less common and less intense.*

## Rainfall Outlook October to December 2025

*Rainfall totals in The Bahamas from October to December are expected to be usual or higher.*

## Temperature Outlook October to December 2025

*This period marks the shift from the Heat Season to the Cool Season. From October to December, both daytime and nighttime temperatures are expected to be at least as high as the seasonal average*

## Climate Outlook January to March 2026

*This period marks the progression of the Caribbean Dry Season to its usual peak by March and the Cool Season. An unseasonably warm North Atlantic around the Northern Caribbean and in the subtropics, potentially combined with La Niña conditions, is forecast for this period—more comfortable temperatures, though likely higher and more humidity than usual, are forecast for this Cool Season. The risk of severe weather impacts from intense shower activity, including flooding, flash floods, and cascading impacts, should decrease from moderate in early January to limited in early March in Belize and the islands. Wherever rainfall totals during this year's Wet Season end up significantly less than usual, the impacts of the 2025-2026 Dry Season will be intensified.*
